August 26, 1997

EXECUTIVE SUMMARY

As a means of implementing a community-based environmental protection approach, members of the Greater Chicago Initiative Team have conducted informational community outreach interviews with environmental and public health organizations in Chicago. During the summer of 1997, the Chicago Team hosted a Society for Applied Anthropology intern to continue the outreach effort, and to provide technical assistance to the team and the Chicago environmental community.

The intern's activities over the course of the summer included the completion of a directory of Chicago area environmental organizations, informational interviews with a wide range of environmental and community based organizations, and the provision of EPA contact names and materials to a number of environmental organizations.

The goals of the community outreach interviews were to:

- assemble a brief history of each organization and its programmatic goals
- identify the most pressing environmental and/or public health issues from a range of local perspectives for incorporation into the GCI strategic planning process
- develop a social map of the interconnections between environmental organizations in Chicago to help identify useful entry points and contacts in the community
- identify the sources of environmental data used in strategic planning or programming

Forty-five interviews were completed over the months of June, July, and August. Out of these interviews, a number of observations, recommendations, and questions for further consideration emerged.

I. Observations

- A relatively small subset of environmental organizations tend to be the “conveners” of large projects and issues in Chicago.
- The “environment” and “environmental problems” are conceptualized differently in each Chicago neighborhood.
- Community based organizations tend to conceptualize environmental issues as quality of life issues. City-wide environmental organizations are more likely to identify ambient contamination, species preservation, or regional development as key issues.
- Local residents are not necessarily concerned about pollution or contamination in other neighborhoods.
- Local environmental activists are often resentful of the intrusion of city-wide activists who offer suggestions and take action in their neighborhood without understanding local dynamics.

- Environmental issues overlap with ethnic and class tensions in Chicago neighborhoods. Sometimes these tensions emerge as a conflict between “white environmentalists” and “minorities who need jobs.”
- Chicago environmental politics are often depicted by a wide spectrum of informants as a battle between “anti-development” and “development” factions.
- The type of environmental data used by the groups interviewed varies widely according to the purpose of the organization, the technology available, staff size, and the availability of data pertinent to the mission.

II. Recommendations

- Continue the community outreach initiative by contacting ethnic organizations, churches, and health promoter organizations.
- Prepare a packet of materials or a series of presentations on community-based environmental protection for public consumption.
- Create a centralized list of environmental justice, environmental education, Chicago Team, and other grants that have been given to Chicago area organizations in order to promote collaborative project development and grant applications.
- Involve local community based organizations and city-wide organization in the CBEP and Sustainable Development Workgroups.
- Involve community development corporations (CDCs) in discussions about sustainable development and environmentally-friendly development practices.
- Host an informational workshop for Chicago environmental groups and the public on EPA processes and procedures, key environmental laws, and grants programs.

III. Conclusion and Questions for Further Consideration

The GCI community outreach interviews have generated a number of long-term questions for consideration:

- In a community based approach in which the “scientific” and community environmental priorities don’t converge, whose vision will take precedence?
- What is the meaning of sustainable development? How important is the development of consensus to the practice of sustainable development? What role should the EPA play in the struggle for consensus?
- How do we conceptualize environmental problems and solutions on a regional basis?

In the short term, the GCI community outreach effort has increased the visibility of the Chicago Team in the environmental community, and provided a wealth of suggestions and community input about environmental and public health priorities in Chicago neighborhoods. By incorporating some of these local-level suggestions into Chicago Team activities, and by monitoring the response to these changes, the Greater Chicago Initiative will contribute to our understanding of the practice of community based environmental protection.

The EPA and Environmentalism in Chicago: Recommendations for a Community Based Approach

Submitted by

Elizabeth C. Babcock

Region V, USEPA

Greater Chicago Initiative

77 W. Jackson

Chicago, IL 60604

August 26, 1997

I. Introduction

As a means of implementing a community-based environmental protection approach, members of the Greater Chicago Initiative Team have been conducting community outreach interviews with environmental and public health organizations. The purpose of the interviews has been to identify the activities and priorities of these organizations, to (re)introduce the GCI as an actor in Chicago environmental and public health, and to develop a strategy for cooperative work among the GCI, public health, and environmental organizations in Chicago. Due to the large number of Chicago environmental and public health organizations, the Chicago Team targeted 10 umbrella organizations for community outreach interviews, anticipating that each of these interviews would yield a number of referrals which could be pursued at a later time.

The Society for Applied Anthropology and the USEPA signed a cooperative agreement in 1996 creating an Environmental Anthropology Fellowship Program. The purpose of this program is to provide anthropologists at the MA and/or Ph.D. level with policy and planning experience in the environmental field, and to provide technical assistance to communities. The Chicago Team of Region V agreed to host a SfAA/EPA intern for the summer of 1997 to continue the community outreach and involvement efforts already under way. John Perrecone in the Office of Strategic Environmental Analysis was designated as the intern's supervisor. The intern's tenure began June 10 and concluded August 26, 1997.

The goals and objectives for this internship included:

- Assist the Greater Chicago Initiative (GCI) in its community outreach initiative by conducting a number of informational interviews with community based and city-wide environmental and public health organizations.
- Provide local environmental and public health organizations a copy of the current GCI action plan, and assist them in making appropriate contacts within the U.S. EPA.
- Obtain information about the types of environmental information used by these local organizations, as well as soliciting feedback about their format preferences for such information.
- Facilitate increased programmatic awareness and collaboration among environmental, public health, and community based organizations in Chicago.

II. Methodology

The intern compiled a city-wide list of over 200 environmental organizations, community-based organizations, and public health organizations. Sources for this list included region-wide organization lists available from the USEPA, resource guides and articles about environmental issues in Chicago newspapers, social services guides published in Spanish language newspapers and publications, a review of neighborhood activities files in the Chicago Public Library, the Chicago phone book, and suggested contacts from EPA personnel. After compiling the list, a classification system was developed and applied to the list.

In consultation with her supervisor; Mardi Klevs, the Chicago Team Manager; and other members of the Chicago Team, the intern selected at least one organization from each category for an interview. Criteria used for this selection included:

- high visibility in the environmental community
- lack of Chicago Team knowledge about its activities
- an environmental focus related as opposed to a social service focus
- location on the southeast or west side of Chicago, target areas for the work of the GCI
- potential for providing additional contacts in the environmental community
- personal interest on the part of the intern

Interviews were scheduled with the director of each organization, or in some cases, with a program director already known to Chicago Team members.

A semi-structured interview format was used for the site visits and interviews. At the beginning of the interview, the intern provided a brief sketch of the purpose and structure of the Chicago Team and a copy of the *Greater Chicago Team Performance Agreement* for 1998. Organizations were asked to review the work plan and offer suggestions about prioritizing the items listed and to identify areas of convergence between their activities and those of the Chicago Team. Organizations were also asked to distribute the work plan to other environmental organizations to their constituents for input. Instructions were given to direct comments and suggestions to Mardi Klevs, the Chicago Team Manager.

Informants were then asked to provide information in the following areas:

- A brief history of the organization including funding sources
- Current areas of programming and activities
- Identification and analysis of the most pressing environmental and/or public health issues in Chicago, and in the local neighborhood in which the organization works
- List of other environmental or public health organizations with which the organization works.
- Sources of environmental data used in strategic planning or programming
- Previous involvement with the USEPA

Interviews concluded with an offer to provide USEPA educational materials, and/or contact names of individuals within the EPA who administer grant or regulatory programs. Phone interviews were shorter in duration, but followed the same general format. Interview reports were prepared and submitted to John Perrecone for review.

III. Observations

Organizational Characteristics

A social network map was prepared to help identify the programmatic linkages between Chicago environmental organizations (see Appendix 1). Organizations with 7 or more linkages to other environmental groups include the Illinois Environmental Education Advocacy Consortium, SUSTAIN, OpenLands, Sierra Club, Friends of the Chicago River, WASTE, and the Chicago Recycling Coalition. These organizations tend to be the “conveners” of large projects and issues. For example, Sierra Club convenes the Lake Calumet Area Strategy Workshop.

Environmental organizations maintain diverse types of membership bases. For example, IL Sierra Club has a membership of individuals numbering in the thousands, but much of the policy work is done by volunteer experts and a 2 person paid staff. Individual volunteers are asked to write letters, make calls to legislators, and to organize themselves into mini-chapters. WASTE, on the other hand, has approximately 30 members, consisting of community based organizations, churches, and environmental organizations.

Environmental groups often change missions and strategies. WASTE, for instance, grew out of a community-specific concern about an incinerator. WASTE now focusses on brownfields redevelopment, illegal dumping, and environmental education.

City-wide environmental groups feel that they are competing for a limited base of volunteers. Likewise, competition between local environmental groups is fueled by grant programs which do not emphasize collaborative efforts.

Some of the same individuals operate as officers in several organizations, especially on the southeast side of Chicago.

Many environmental organizations see themselves as public educators and advocates for environmental issues in which government agencies have little or no jurisdiction.

Environmental Issues Identified

The “environment” and “environmental problems” are conceptualized differently in each Chicago neighborhood. “Environmental concerns” elicited from interviews include personal safety, garbage pick up, graffiti, asthma, lead poisoning, toxins in schools, environmental risks stemming from imported food and goods, gangs, greenspace, illegal dumping, noxious odors, mysterious fogs spewing out of smokestacks, brownfields redevelopment, air pollution, communicable diseases, lead poisoning, unsafe water, prostitution, drug dealing, handicap accessibility, fish contamination, food contamination, animal rights, soil contamination.

Community based organizations tend to conceptualize environmental issues as quality of life issues, citing safe housing, health issues, violence, and jobs as primary concerns. City-wide environmental organizations were more likely to talk about air, water, and soil contamination, or species preservation as key issues. Community based organizations recognize ambient contamination as a quality of life issue, but they tend to say that day-to-day survival needs are more important. The exceptions to this pattern seem to be community-based umbrella or coalition organizations which maintain a geographic focus. Several of the brownfields projects (CANDO, WCMC, Friends of the Chicago River) have advisory committees on which USEPA, IEPA, and DOE personnel participate as volunteers. These advisory committees could serve as the basis for improving communication between these agencies.

Brownfields redevelopment in Chicago faces several challenges including lack of money for environmental cleanup and assessments, and a reluctance on the part of municipalities to actively identify brownfields sites for fear of negative publicity.

One of the difficulties with the pollution prevention initiatives is the reluctance of businesses to participate in a program staffed by state or federal personnel. Nonprofit organizations may be able to improve participation rates in pollution prevention programs by providing technical assistance. The North Business Industrial Council already provides these services, and CANDO is interested in becoming involved. Pollution prevention is also made more difficult by a lack of finances for capital improvements.

Neighborhood Dynamics

The Southeast side of Chicago consists of a number of insular, and well-defined neighborhoods, each with their own identity and history. (Locally identified neighborhoods in the southeast side include The Bush, South Deering, Slag Valley, East Side, South Chicago, and Hegewisch.) While the USEPA seeks to address environmental issues from a regional perspective, local residents are not necessarily concerned about pollution or contamination in other neighborhoods.

“Pride in place” is cited by some community organizers as a necessary component of environmental protection and community development. A number of organizations operate community garden programs in vacant lots as a means of beautifying the neighborhood and instilling a sense of ownership and pride in the area. The Juan Diego Community Center used to operate an environmental education class for students in South Chicago that emphasized the unique and colorful history of their neighborhood.

Communities are not static, and people move around within the city. As people move, they take with them practices, experiences and beliefs about the environment learned in one area of the city. Intra-city movement is also fueled by environmental concerns and the desire to reduce risk.

Local environmental activists are often resentful of the intrusion of city-wide activists who offer suggestions and take action in their neighborhood without understanding local dynamics.

Individual determinations of environmental risk are dynamic. A VISTA volunteer in one of the southern neighborhoods told me that an increasing number of residents choose to drink bottled water for fear of water contamination. According to this volunteer, a resident in the community, this behavior can be attributed to the large number of television commercials for water purification filters.

Environmental issues overlap with ethnic and class tensions in Chicago neighborhoods. Sometimes these tensions emerge as a conflict between “white environmentalists” and “minorities who need jobs.”

Chicago environmental politics are cast as a battle between “anti-development” and “development” by a wide spectrum of those interviewed.

Some environmental advocates characterize “ozone action days” as “personal responsibility campaigns” which are destructive to the larger environmental mission. These environmentalists acknowledge that ozone action days might assuage guilt and provide an individual with the sense that he or she is “really doing something.” However, these programs fail to mention that the primary source of some forms of pollution is industry. Ozone Action Days distract people from the need to advocate for fundamental policy change.

Data Issues

The type of environmental data used by the groups interviewed varies widely according to the purpose of the organization, the technology available, staff size, and the availability of data pertinent to their mission. Groups like the Environmental Law and Policy Center use USEPA data on utility pollution. Other groups like Friends of the Parks use city ordinances and city plans as leverage for their own objectives. Some organizations rely on university-based programs such as PRAG to conduct policy-oriented research for them. Other organizations use services such as the Metropolitan Chicago Information Service to obtain survey data on questions they design themselves. Several of the groups suggested that there is a need for environmental and public health data that can be correlated to neighborhood level population demographics.

Organizations interviewed requested more information on the process of updating USEPA databases. Some found that the data was incommensurable since it was drawn from so many sources.

Funding Issues

Some organizations feel that EPA grant requirements work in opposition to community based efforts. As one organization leader pointed out, community driven environmental protection will be an emergent process, and the grant proposal and evaluation structure allows little room for emergent projects.

IV. Recommendations

Continue Community Outreach Efforts

- Consider networking with Metropolitan Sponsors before its inaugural event this October. Metropolitan Sponsors is a city wide movement of community based organizations (CBOs) and churches from across the city. Its purpose is to provide CBOs with a city-wide base of support for quality of life and community development issues.
- Contact ethnic organizations not normally considered to be part of the environmental network. These organizations operate small environmental-related programs that go unnoticed. Suggested organizations include: Chicago Urban League, the Resurrection Project, Casa Guatemala, Operation PUSH, NAACP, Casa Aztlan, Comite Latino, Latino Institute, and Latinos United.
- Contact churches in target areas. Many local churches sponsor community based organizations that have environmental concerns and or programs. Churches also build environmental coalitions. For example, the “sacred space park” is a greenspace initiative spearheaded by the Green and Clean Task Force of Claretian Associates. *Comunidades de bases* are another form of geographically-based social organization nested within the Catholic Church that could be used as conduits into the community.
- CAPS meetings are already well established in some neighborhoods and could be used as conduits to distribute information or to obtain information about environmental concerns and solutions.
- Use health promoter organizations as sources of information and as a means of distributing information.
- Radio and student environmental programs operated out of universities, and neighborhood based community organizations should also be included in outreach efforts.
- Ask Chicago Team members, and the other popular granting departments like Environmental Education and Environmental Justice to keep a log of calls tracking the success of the outreach initiatives in Chicago.

Improve Information Flow between Environmental Organizations and EPA Programs

- Rewrite the Chicago Team Work Plan in a fact-sheet format and translate it into Spanish.
- Prepare a packet of materials or a series of presentations on community-based environmental protection for local community based organizations and city wide environmental organizations. Presentations could be given at schools, at beat meetings, and at churches.

- Create a centralized list of EJ, EE, Chicago Team, and other grants that have been given to Chicago area organizations. This list could be used by environmental organizations to research the types of grants available and to explore opportunities for collaborative project development and grant applications.
- When conditions of USEPA grants change, convey the information quickly to grantees
- Develop a mechanism to regularly obtain copies of the numerous reports that nongovernmental organizations publish on environmental issues in the Chicago area. The Sierra Club and the American Lung Association produce many such reports.
- Use the Greater Chicago Initiative Web Page to promote collaboration between Chicago environmental groups.

Investigate Opportunities for CBEP Research

- Utilize information services such as the Metropolitan Chicago Information Service, and PRAG researchers to obtain information about environmental beliefs and practices in Chicago.
- Where possible, identify opportunities for applied sociocultural research on environmental issues in Chicago. For example, the methylparathion situation provides an opportunity to examine how crisis intervention on the part of the EPA affects subsequent individual environmental practices.

Assume a Catalytic Role in the Chicago Environmental Community

- Involve local community based organizations and city-wide organization in the CBEP and Sustainable Development Workgroups.
- Foster collaboration between community based organizations and city-wide or coalition-based initiatives by providing information about complementary programs and encouraging collaborative grant proposals.
- Involve community development corporations (CDCs) in discussions about sustainable development and environmentally-friendly development practices. A large number of CDCs operate in areas of Chicago where environmental concerns are a priority.
- Host an informational workshop for Chicago environmental groups and the public on EPA processes and procedures, key environmental laws, and grants programs. Many groups have only a limited understanding of the jurisdictional issues and procedures of the USEPA. Many know only of the enforcement and compliance aspects of the agency's work.

- Involve federal Americorps and VISTA volunteers in CBEP initiatives in Chicago. Several of the CBOs interviewed, such as the Juan Diego Community Center, already use Americorps and VISTA volunteers.
- Continue to sponsor workshops and conferences like the endocrine disruptor conference. Expand the invitation list to include more local organizations and health related organizations.

V. Questions for Further Consideration

- Citizen's concerns about the environment and public health arise out of local knowledge systems, long-term experience, and cultural beliefs that are persistent. "Scientific" risk calculations do not necessarily give rise to the same environmental priorities as those identified by a community. In a community based approach, in which the "scientific" and the community priorities don't converge, whose version of environmental priorities will take precedence? Does CBEP entail listening to and incorporating all of the suggestions and concerns from within a diverse community? Whose voice should be given the most weight? How will these decisions be made?
- How important is it to educate the public about the limits of scientific approaches to environmental protection? Some environmentalists point out that human and ecological risk assessment leads to a false sense of security, given the assumptions embedded in making such assessments.
- What is the meaning of sustainable development? For some community development organizations, sustainable development means community-driven development in which local residents decide what types of jobs should be attracted to the area, and what use should be made of vacant lots. Some activists view the efforts to lure low paying industry back into the city as a step backward, since these industries do not provide a living wage. For others, sustainable development means enticing "green manufacturers" into the city. Some say sustainable development involves pollution prevention and cracking down on "bad business." How important is the development of consensus to the practice of sustainable development? What role should the EPA play in the struggle for consensus?
- How do we conceptualize environmental problems and solutions on a regional basis? How do we develop regional tools and strategies? What are the meaningful sociopolitical boundaries for addressing environmental issues in the Chicago area from a regional perspective?
- How do you change a cultural behavior, (such as the use of mercury in healing and religious practices, or illegal dumping), that poses a human health risk? Under what circumstances should the practice be changed? What are the ethical issues involved in attempting to change this practice?

A. USEPA Spanish and English educational materials on asthma, lead, illegal dumping, and/or methylparathion sent to the following organizations:

Our Lady of Tepeyac St. Kevins Church
Centro Comunitario Juan Diego Westside Health Authority
Bethel New Life Hispanic Health Alliance, Chicago Department of Public Health

B. USEPA brownfields materials sent to the following organizations:

CANDO

C. USEPA Environmental Justice materials requested by:

Friends of the Parks UNO

D. Sent community-based environmental protection and/or sustainable development materials taken from the EPA homepage to:

OpenLands WASTE

E. Referrals to Suzanne Saric in Environmental Education

Caretakers of the Environment Friends of the Parks
WASTE

F. Referrals to Carole Braverman in International Programs

Caretakers of the Environment UNO

G. Inter-organization referrals:

- Referred Caretakers of the Environment to IEEAC, the Eco-Citizenship Program at the Chicago Academy of Sciences, and IL Eco-Watch Program.
- Referred St. Kevin's Church to LEAD for more information on lead poisoning.
- Arranged for Amy Nerbun to make a wetlands presentation at St. Kevin's Church.
- Referred ELPC to IL Solar Energy Association.
- Referred Multiple Chemical Sensitivities to Conscious Choice Magazine.
- Referred Friends of the Parks to Andre Guinther of the National Park Service, PRAG,
- Referred Christine Kosmos of the Chicago Department of Public Health to Tom Yeates, the SEEP working on lead issues.
- Referred Elissa Speizman to Irma Trantor, Executive Director of Friends of the Parks, regarding an inquiry about co-sponsoring Earth Day.
- Referred Westside Health Authority to Pat Easley regarding job training.
- Referred UNO to the Ecological Citizenship Program at Chicago Academy of Sciences.
- Contacted Phillipa Cannon regarding ELPC request for information about CEO's who have spent jail time for polluting.
- Referred ELPC to George Cerniak and Steve Rothblatt in the Air Division at USEPA.
- Greg Carlson of USEPA will provide alternative remediation plans for the Van Vlissingen Prairie to CEPA.

- Referred Westside Health Authority to Tom Yeates, SEEP working on lead issues.
- Mick Hans added SCDCOM and the Great Lakes Center for Occupation and Environmental Safety and Health to the public notice mailing list.
- Referred IL-EcoWatch to the Chicagoland Environmental Network.
- Referred CEPA to the Landmarks Preservation Council of IL.
- Pablo Valentin will send the Chicago Department of Public Health report on mercury use to Our Lady of Tepeyac.
- Sent Wild Onion Alliance information on renewable energy resources.
- Referred Rebecca Riley at the MacArthur Foundation to Suzanne Saric (EE), Margaret Millard (EJ), Holly Wirick (renewable energy), Paul Rusch (green construction).
